

The missing part of your BASE24™ architecture is now available

Your TLF, PTLF, Journal and other transaction logs contain your most valuable business information, yet few companies can react to that data in real-time because of the effect it will have on the performance of their core BASE24 platform.

As a result, data that could have indicated such things as business problems or sales opportunities; fraud or organised attacks can only be studied after the event.

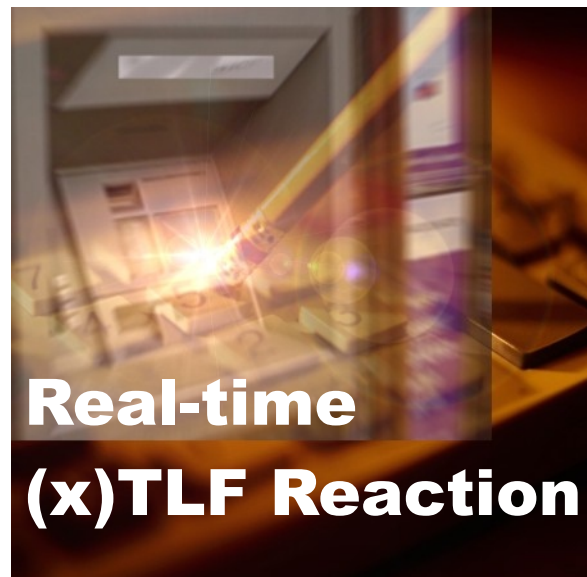

Until now . . .

Insider's RTLX product is not just a Reaction Engine and Traffic Cop combined, it is a whole new extension to BASE24, with a *uniquely fast method of streaming data* off the BASE24 host and onto a dedicated Reaction Server, running Windows+SQL Server.

Based on the proven and successful SENTRA architecture, RTLX lets you probe and analyse the real-time flow simply by setting rules and triggers via point and click techniques. In addition, the advanced Reporting Engine can compile service and availability data with automated or scheduled forwarding and business trigger points.

RTLX works with both BASE24 and BASE24-es environments.

Install RTLX and you'll wonder how you ever lived without it.

- (x)TLF data is instantly streamed off the BASE24 host to a dedicated Reaction and Analysis engine (Windows).
- Rules process against data on arrival, ensuring ultra-high performance of the data-driven environment and shifting the load off BASE24.
- Flow and Trap Rules are set via web-based point and click instructions against the chosen data subsets that you define as most relevant to your business.
- Build up and report on complex patterns of normal vs abnormal business activity such as Issuer/Acquirer performance or card usage.
- Ability to track specific events, such as "show me the next time one of this range of cards is used in this location", or "alert me if a card keeps trying with lessening amounts".
- Full lifecycle reporting of any disputed transaction.
- Dynamic reporting subsystem with drill down graphing and automated email forwarding to response groups.
- Service rules trigger visual, SMS, pager or email alerts; with certified support for major enterprise management regimes.
- Dynamic replay of critical time periods.
- Secure and resilient architecture, centrally deployed and self-monitoring.

Why buy or develop multiple products when you can do it all with one!
